# IMPACT OF 2018 PROMOTIONAL CAMPAIGN

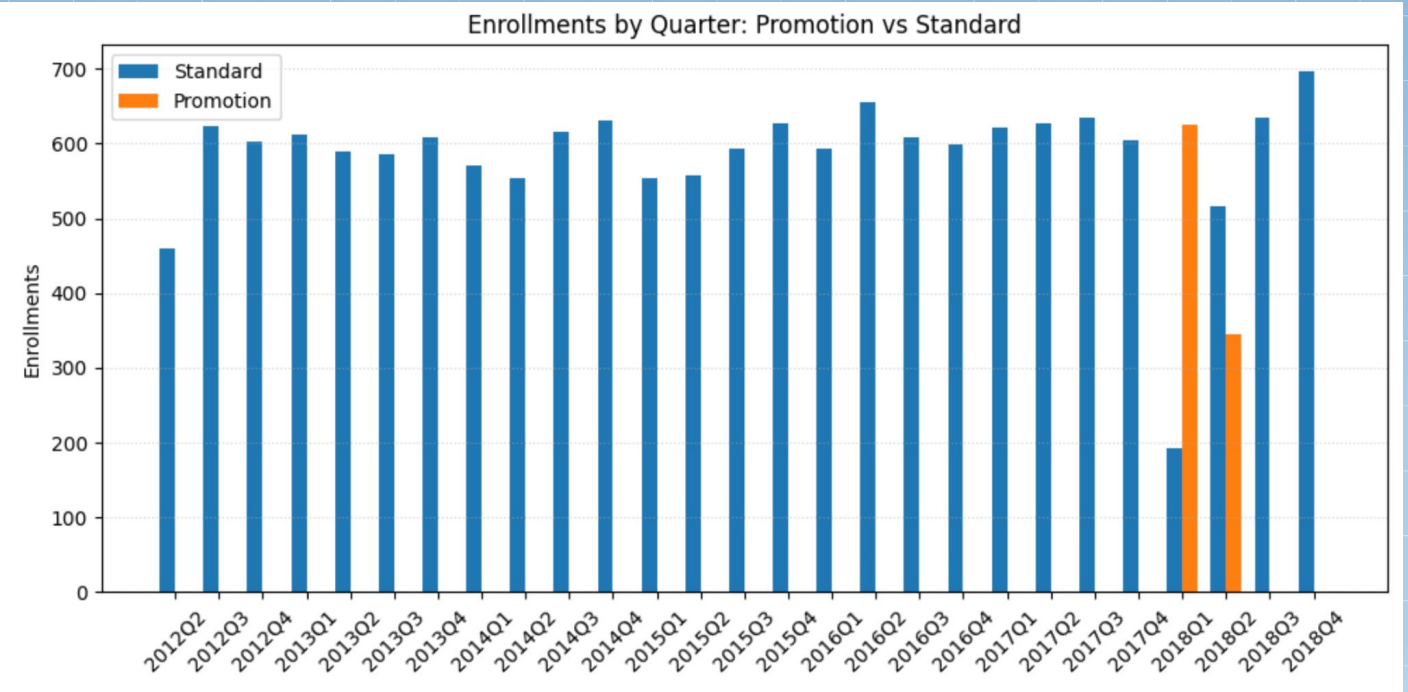

Richard Pacifico
Business Analytics Final Project

# OBJECTIVE

- Figure out how the promotional campaign impacted loyalty memberships
- Look at customer acquisition, customer retention (churn), and develop insights into promotional success
- Was there an increase in miles flown in the loyalty program?

# LOOK AT STANDARD VS PROMO ENROLLMENT

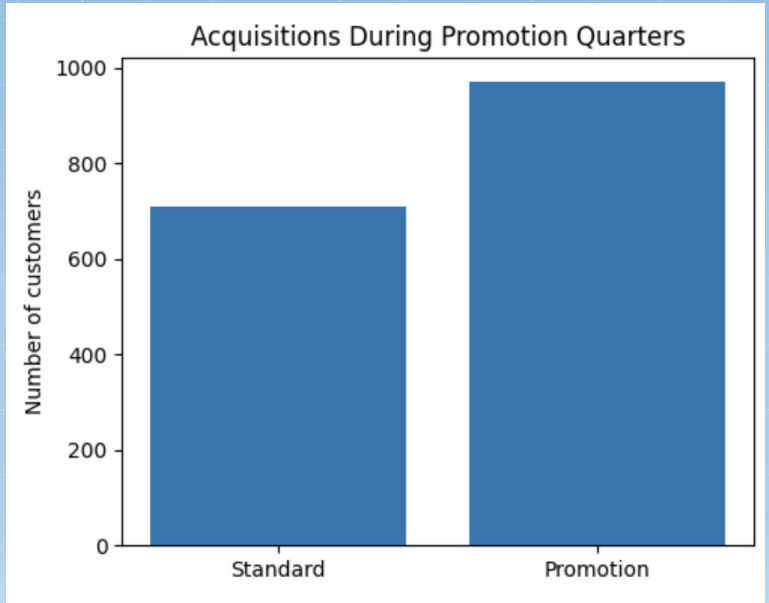

First, I wanted to look at overall loyalty membership enrollment. For subsequent analysis and visualization, I will focus on the customers who enrolled during 2018 Q1 and 2018 Q2 (the quarters where a promotion was available).

# CUSTOMER SIGN UPS DURING THE QUARTERS A PROMOTIONAL CAMPAIGN WAS OFFERED

**42.2%**

## STANDARD

There were 708 standard enrollments during the quarters where a promotion was available.

**57.8%**

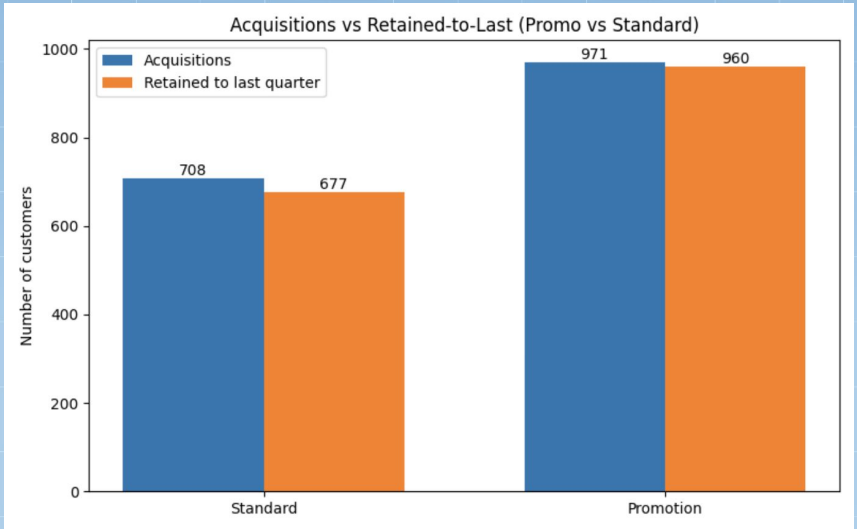

## PROMOTION

Acquired 971 members via promotion over the two quarters where the promotion was available

A 2018 promotion was available during 2018 quarter 1 and 2018 quarter 2. I am looking at those quarters specifically to see who signed up regularly versus because of the promotion.

# RETENTION OF CUSTOMERS WHO SIGNED UP DURING 2018 Q1 AND Q2

If a customer signed up because of the promotion, did it impact if/when they cancelled their membership?

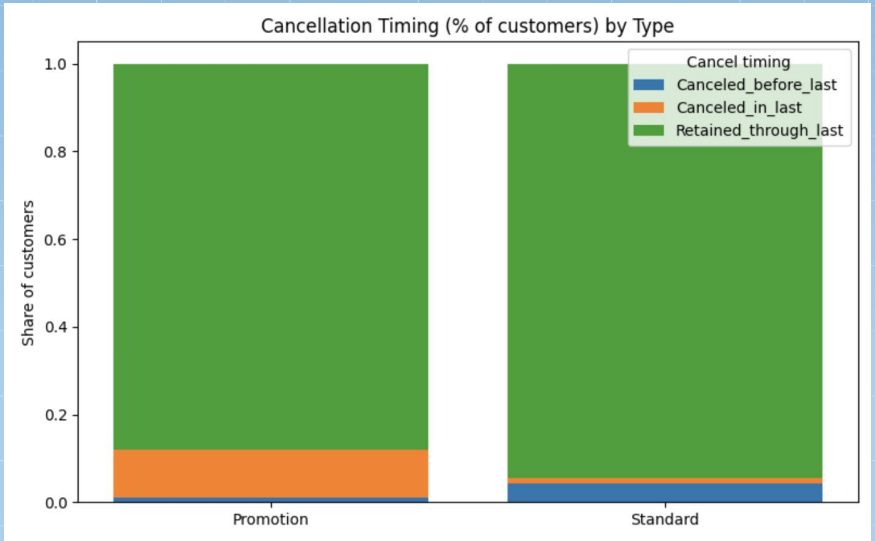

Here I am looking at the percentage of people who did **not** cancel in or during the last quarter

- 98.9% of promotion sign ups were retained
- 95.6% of standard sign ups were retained

# RETENTION OF CUSTOMERS WHO SIGNED UP DURING 2018 Q1 AND Q2

If a customer signed up because of the promotion, did it impact if/when they cancelled their membership?

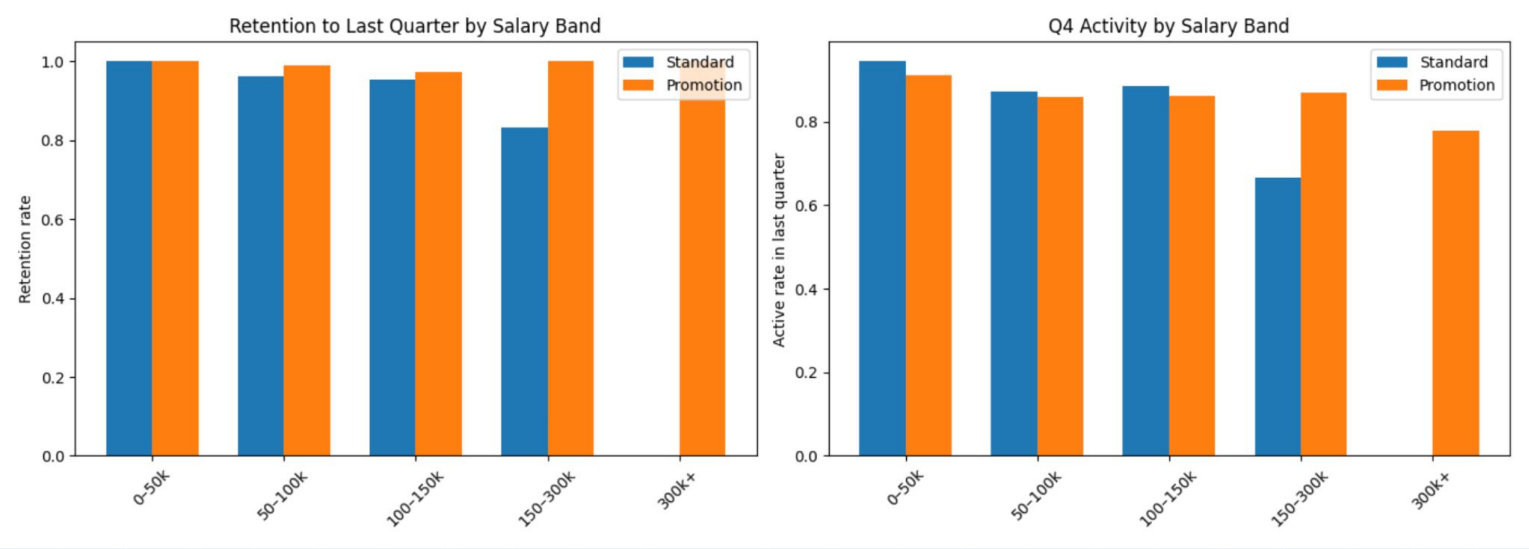

Next I wanted to see for the people who **did** cancel, when did they cancel?

- 10.7% of the promotion sign ups who cancelled did so in the last quarter (still a small percentage of the overall promotion sign ups, but notable).

# FURTHER ANALYSIS: DID INCOME BAND IMPACT RETENTION OR ACTIVITY?

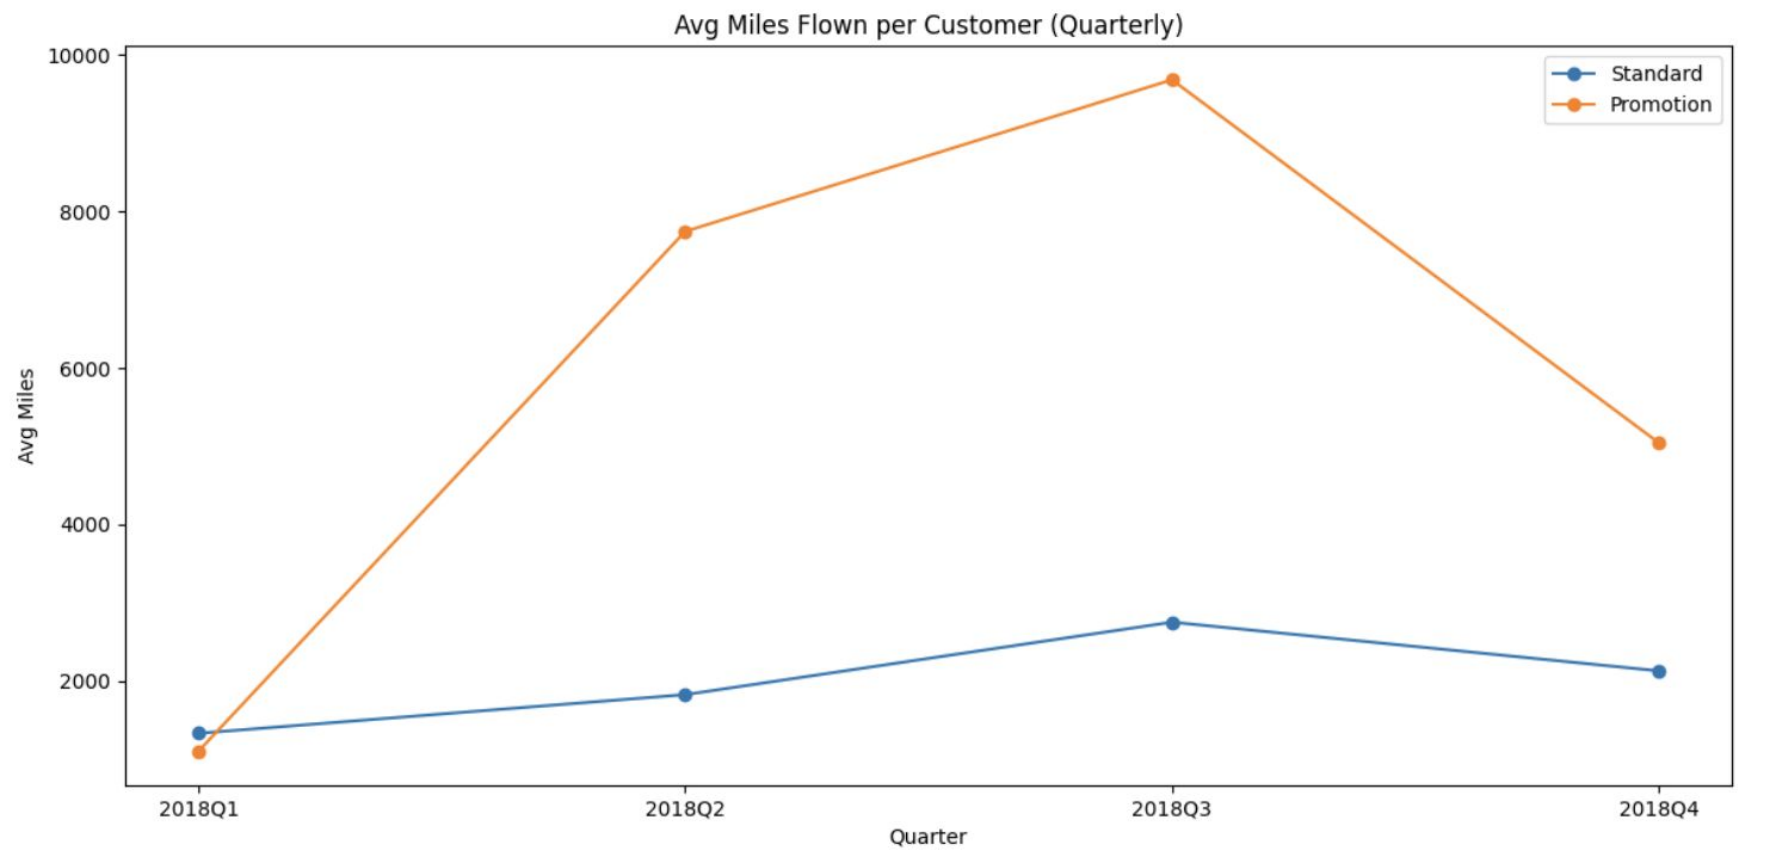

I took all of the salaries and grouped them into income bands so that I could compare groupings.

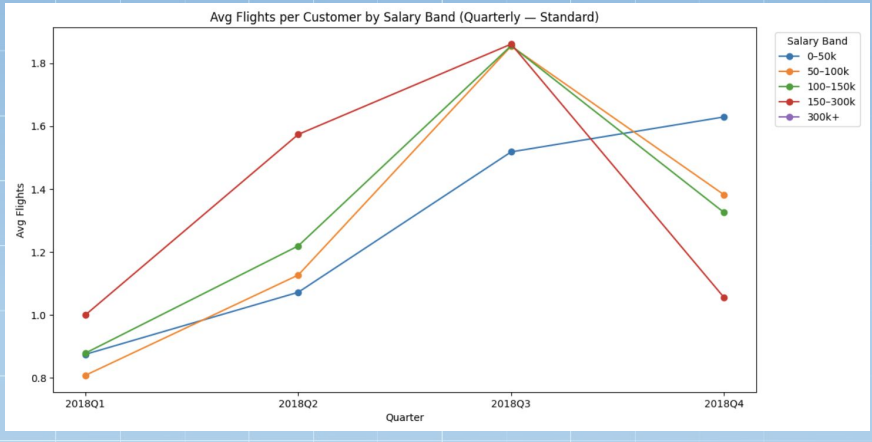

Retention was equal for the lowest income bracket (0-50k). For all subsequent salary bands, promotion retention was always higher

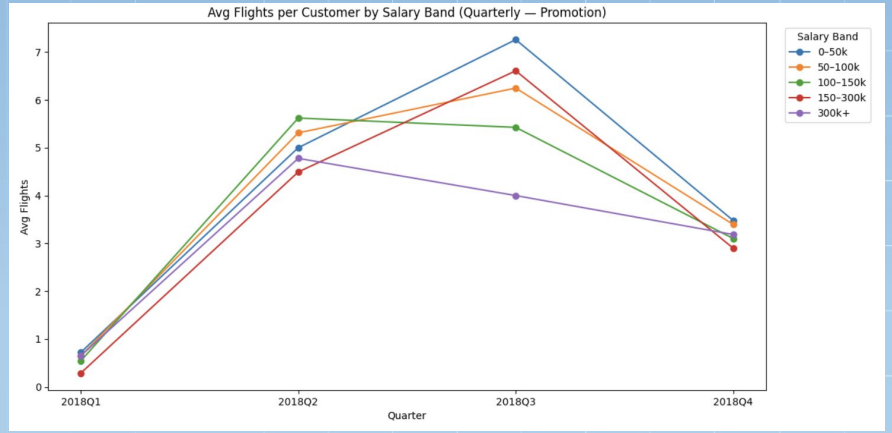

The y axis represents the percentage of customers who were active (taking one or more flights) in the last quarter. Interestingly, activity was higher among standard sign ups for bands 0k - 150K).

# PROMOTIONAL CUSTOMERS FLEW MORE MILES ON AVERAGE

# SALARY BAND WAS MORE RELEVANT FOR PROMOTIONAL CUSTOMERS

Salary has a much stronger impact under promotion than non-promotion, with lower-income customers (0–100k) showing the largest increase in flights when promoted. In contrast, non-promotion customers show relatively modest and flatter differences across salary bands, indicating salary may play a smaller role without promotional incentives.
